About this illustration

This report was exported by Qanlyst from a fictional sample workspace. All participants, responses, and quotations are invented. It demonstrates document structure and traceability, not research or clinical evidence.

Example research question: How do daily routines and support relate to the fictional adherence scores? A convergent mixed-methods example places survey summaries beside interview accounts. No causal conclusion is drawn.

Sample and method

The dataset contains 36 synthetic paired baseline and follow-up responses. Descriptive statistics were calculated with the Qanlyst statistics engine. All 36 records had values for both selected variables; no values were imputed.

The qualitative example uses an invented transcript. The passage was coded as Routine and reminders. The combined display illustrates complementarity: an account can add context to a numerical summary without establishing why scores changed.

Illustrative findings

Measure	Baseline	Follow-up
Valid responses	36	36
Mean	60.00	67.47
Standard deviation	12.25	13.77

The summaries describe the invented values only. A difference between the means is not evidence of a treatment effect.

Quantitative strand	Qualitative strand	Combined interpretation
Baseline mean 60.00; follow-up mean 67.47 across 36 invented records.	“I keep my medication beside my breakfast cup. That makes it easier to remember.” — Fictional participant P001	The account shows how a routine might be described. It adds illustrative context; it does not explain the score change or establish causation.

Limits and source trail

No real people, clinical records, or external study results were used. The sample was constructed to demonstrate the product. It cannot support generalization, a clinical recommendation, or a claim about real-world effectiveness.

Sources: synthetic Baseline and Follow-up Survey, version 1, revision 36; fictional interview P001, first participant turn. Statistical input and output are retained in the isolated sample workspace. This exported document is a static illustration; it does not grant access to that workspace.
